

"Will stem cells work for me?" is what many patients ask us. And it honestly really depends. We qualify our patients and we make sure that they're good candidates. If somebody's just taken Tylenol or ibuprofen, that's the only thing they've done for their condition, well they're not quite a stem cell candidate. We also have those that have already had a joint replacement surgery. They're not a candidate because there's nothing there to heal and repair. And then we have to make sure that there is some cartilage there, that they truly have something that is there to be able to regenerate and repair. And it's those candidates that we've found really high success rates with.
